CARDIAC ENZYMES

TEST	CPK	CKMB MASS	TROPONIN-I
REF RANGE	45-235	0.3-4.0	< .03
UNITS	U/L	ng/mL	ng/mL
07/17/01 0630	3394 H	12.3 Hf	.21 Hf
07/17/01 0020	1053 H	5.3 Hf	.21 Hf
07/16/01 2045	344 H	<0.3 f	.23 Hf
07/16/01 1905	280 H		

CKMB MASS (03/04/98 - Current)

CKMB Mass levels increase rapidly and peak within twelve hours of an acute myocardial infarction. The levels then decline to normal at thirty-six to seventy-two hours. CKMB Mass analysis exhibiting this pattern along with evolutionary changes in the ECG and history of chest pain contribute to a diagnosis of acute myocardial infarction. The removal of interfering entities such as CKBB, macro-CK, and adenylate cyclase in the CKMB Mass analysis provides improved cardiac specificity.

TROPONIN-I (03/12/98 - Current)

Less than 0.03 ng/mL = Normal or Negative (SUGGEST REPEAT AT 2-4 hour interval for confirmation).

0.03 ng/mL - 0.15 ng/mL = Indeterminate, possibly representing minor myocardial damage. Serial draw suggested 2-4 hours later for clarification.

Greater than 0.15 ng/mL = AMI cutoff (Positive). Repeat serial testing suggested at 2-4 hour intervals for confirmation.

Cardiac Troponin-I (cTnI) becomes elevated approximately six hours after the onset of chest pain in an acute myocardial infarction. Its concentration peaks around twelve hours and remains elevated for almost a week after myocardial infarction.

07/17/01 0905	63 Hf	

AMMONIA, ARTERIA (03/06/01 - Current)

Samples for ammonia determination are extremely labile. Optimal sample collection requires the sample to be placed on ice immediately, centrifuged as soon as possible for 10 minutes, and analyzed within 30 minutes. Samples should not be frozen. Results from samples not collected, processed, and analyzed in this manner should be interpreted with caution.

TEST	HIV	HBs AG	HbC AB	HEPATITIS C AB
REF RANGE	NON REAC	NON REAC	NON REAC	NON REAC
07/17/01 1200	NON REAC f	NON REAC f	NON REAC f	REACTIVE *f
HIV (08/22/96 - Current)				

This method detects antibodies to both HIV-1 and HIV-2. A non-reactive result indicates that neither HIV-1 or HIV-2 antibodies were present.

HBs AG (07/31/00 - Current)

Hepatitis B Surface Antigen is a qualitative enzyme immunoassay that should be interpreted as a presumptive screen. Neutralization or another more specific method should confirm samples producing repeatedly reactive results unless the repeatedly reactive result is expected.

HbC AB (01/16/98 - Current)

Hepatitis B Core Antibody

IT IS RECOMMENDED THAT PATIENTS EXHIBITING BORDERLINE RESULTS BE MONITORED OVER TIME (APPROXIMATELY 1 WEEK INTERVALS) TO DISTINGUISH RISING IGM ANTI-HBC LEVELS (ASSOCIATED WITH ACUTE HEPATITIS INFECTION) FROM FALLING OR UNCHANGING IGM ANTI-HBC LEVELS (ASSOCIATED WITH RECOVERY).

HEPATITIS C AB, 07/17/01 1200

POSITIVE HEPATITIS C ANTIBODY SCREEN WILL BE CONFIRMED BY HCV-RIBA ANALY

HEPATITIS C AB (01/26/99 - Current)

Negative assay results in individuals with prior exposure to HCV may be due to reduced or absent antibody reactivity to HCV antigens.

Specimens which contain antibodies to either vector or fusion proteins associated with the HCV recombinant antigens may demonstrate false positive results.

ADAPTED FROM HIRSH, ET AL: CHEST 1992;102:312S-326S.

PTT (05/05/99 Current)

A commonly recommended therapeutic range is a PTT ratio of 1.5 to 2.5 times the control value. Based on a dose of 0.20 U/ml to 0.40 U/ml observed correlation (CV=8.5%) with current use heparin lots has been acceptable. For details of heparin response curves, please contact the Coagulation Department of the Laboratory.
